
Index

A

- Angiotensin II,
 - quantum dot conjugate preparation,
 - materials, 52, 53
 - synthesis, 53, 54
 - receptor imaging with conjugated quantum dots,
 - Chinese hamster ovary cell culture, 54, 57, 58
 - fluorescence imaging, 55–58
 - labeling conditions, 55, 58
- Antibody-conjugated quantum dots, *See* Fluoroimmunoassay

B

- Beads, quantum dot encoding,
 - fluorescence imaging and spectroscopy, 66–69
 - materials, 62
 - multicolor quantum dot preparation, 62, 63, 67
 - overview, 61, 62
 - porous microbead synthesis,
 - polystyrene-based mesoporous microbeads, 64
 - polystyrene-based nanobeads, 63, 64
 - silica-based mesoporous microbeads, 64
 - tagging and surface functionalization, 64–68

C

- Carbon nanofibers,
 - microinjection approaches, 191, 192
 - vertically aligned nanofibers,
 - applications, 192, 203–206
 - DNA delivery in cells,
 - materials, 192, 193
 - plasmid DNA spotting and covalent modification, 196–198
 - fiber-DNA penetration of cells using microcentrifugation,

- optimization, 200–203
 - pressing steps, 203
 - pressing surface preparation, 199, 200
 - spin tube preparation, 198, 199
- synthesis,
 - catalyst deposition, 194
 - excess metal removal, 194, 195
 - growth, 195, 196
 - materials, 192
 - overview, 193
 - substrate patterning, 193

CD, *See* Circular dichroism

Circular dichroism (CD), peptide-encapsulated nanoclusters, 137, 138, 140, 141

Colloidal gold, *See* Gold nanoparticles; Gold nanoshells

Combinatorial peptide library screening, *See* Nanoclusters

Computers, DNA-based, 161, 152

Cytosensor™ Microphysiometer,

- cycles, 211
- electrodes and oxidase reactions, 211–213
- living cells as nanoscale analytical detectors, 209, 210
- metabolism analytes, 210
- multianalyte determination,
 - calibration curve, 219, 220
 - metabolic agent addition, 219, 221
 - overview, 211–214
 - programming parameters, 218, 219, 221
- sensor head modification,
 - attachment to instrument, 218
 - materials, 214, 216
 - oxidase coating, 216–218, 221
 - physical modifications, 216, 220, 221
 - quality assessment, 218

D

DNA delivery, *See* Carbon nanofibers

DNA nanotechnology,

- branched DNA,
 - combination with sticky ends, 150
 - inexact complementarity, 144–146
 - sequence symmetry minimization, 151, 152
 - computation principles, 161, 162
 - conformational transitions, 157, 158
 - DNA object generation, 151, 153
 - double crossover, 149
 - helix structure, 143, 144, 179
 - Holliday junction, 149, 150, 155
 - interhelical cohesion, 147–150
 - nanomechanical devices, 155–160
 - periodic arrays,
 - applications, 144, 145, 154, 155
 - integrity, 155
 - tiling with crossover patterns, 155, 156
 - polarity crossover, 149, 150
 - prospects, 162, 163
 - reciprocal exchange of strands, 148, 149
 - semiconductor nanoparticle templates,
 - materials, 168
 - overview, 167, 168
 - plasmid,
 - maps, 169
 - template synthesis and purification, 168, 170
 - quantum-confined cadmium sulfide nanoparticle/plasmid network preparation,
 - deposition by floating grids in solutions, 173, 177
 - mixing of cadmium and DNA, 172
 - reactant adsorption onto solid supports, 173, 177
 - sequential addition of DNA and cadmium to metal, 173, 174, 177, 178
 - solution preparation, 171, 172
 - sulfide reaction, 173
 - transmission electron microscopy,
 - carbon substrate fabrication, 170, 171, 177
 - carbon substrate preparation on copper grids, 171, 177
 - characterization, 174, 175
 - sticky-end cohesion, 146, 147
 - structure probing with nanoparticles,
 - binding kinetics studies, 185, 186
 - CdS nanoparticles,
 - activation with Cd(II), 181, 187
 - mercaptoethanol capping, 181, 182, 187
 - synthesis, 180, 181, 187
 - DNA purification, 182, 183, 187
 - materials, 180
 - overview, 179, 180
 - reverse salt titrations, 186, 187
 - titration of quantum dots with duplex DNA and photoluminescence microscopy, 183–185, 187
 - triple crossover, 149
 - Drug delivery nanoparticles,
 - controlled release, 122
 - size optimization, 121, 122
 - surface functionalization and conjugation,
 - characterization of nanoparticles, 127, 129
 - materials, 122
 - nanoparticle functionalization, 126
 - nanoparticle preparation,
 - dialysis, 125, 126
 - emulsification-diffusion, 124, 126
 - nanoprecipitation, 124, 126
 - overview, 122, 123
 - poly(lactide-co-glycolic acid)-tetracycline conjugation, 125–128
- E**
- Enzyme electrodes, *See* Cytosensor™ Microphysiometer
- F**
- Fluorescence microscopy, *See* Angiotensin II; Beads, quantum dot encoding; Immunocytochemistry; Nanobarcodes® particles
 - Fluoroimmunoassay,
 - basic zipper fusion protein preparation, G protein vector construction and expression, 27–29

- maltose-binding protein vector
 - construction and expression, 25–27
 - purification, 29, 30
 - coating of quantum dots,
 - MBP-zb/avidin/IgG, 30, 32, 33
 - PG-zbMBP-zb/IgG, 30, 31, 33
 - materials, 20–22
 - overview of quantum dot assay, 19, 20
 - quantum dot synthesis,
 - CdSe core, 22, 23, 32
 - dihydrolipoic acid capping and water solubilization, 24, 25
 - purification, 23
 - ZnS overcoating, 23, 24
 - sandwich immunoassay, 31–33
 - single-chain fragment variable antibody
 - screening, *See* Single-chain fragment variable antibody screening
- FMAT™, *See* Single-chain fragment variable antibody screening

G

- Gold nanoparticles,
 - applications of bioconjugates, 85, 86
 - bioconjugate preparation,
 - bovine serum albumin-peptide conjugates,
 - albumin-crosslinker
 - characterization, 89, 90, 97
 - conjugation conditions, 90
 - peptide conjugation to albumin, 87–89
 - direct peptide conjugation, 90, 91
 - characterization of peptide conjugates, 91, 92
 - intracellular imaging of colloidal gold
 - using video-enhanced differential interference contrast microscopy,
 - image acquisition, 95, 97
 - instrumentation, 93–95
 - peptide conjugates, 96
 - stability, 96, 97
 - synthesis, 87
 - transmission electron microscopy, 92
 - Gold nanoshells,
 - fabrication,
 - gold colloid growth, 104

- nanoshell growth, 105, 110
 - principles, 103, 104
 - silica cores,
 - amination, 104
 - coating with colloidal gold, 105
 - growth, 104, 110
 - rinsing, 105

- immunoassay of whole blood,
 - absorbance spectroscopy, 109
 - analysis, 109, 110
 - antibody conjugation to nanoshells,
 - antibody binding to polyethylene glycol tethers, 106
 - assembly, 107, 108, 111
 - polyethylene glycol-thiol
 - synthesis and concentration optimization, 106, 107, 111
 - stability of conjugates, 111
 - materials, 102, 103
 - overview, 101, 102
 - sample preparation, 108, 109
 - standards, 109
 - plasmon resonance, 102, 103, 110
 - structure, 102

H

- Holliday junction, DNA nanotechnology, 149, 150, 155

I

- Immunocytochemistry,
 - quantum dot applications, 9–11, 35
 - streptavidin quantum dot labeling of
 - cell-surface proteins,
 - biotinylation,
 - antibodies, 39–41, 47, 48
 - cell surfaces, 39–41, 48
 - detection with biotinylated antibodies, 41, 48
 - imaging, 42, 43, 45, 48, 49
 - materials, 36, 37
 - overview, 35, 36
 - streptavidin quantum dot and
 - fluorophore incubation conditions for labeling, 41, 42, 48
 - tissue culture,
 - HEK293 cells, 38, 47
 - hippocampal neurons, 37, 38
 - media, 45
